A. BASIC MAINTENANCE FOR P.C.BOARD

Almost of troubles can be repaired by exchanging an IC. To find out what IC is defective, examine P.C.Boards in the following procedure. At the same time, carefully check for damage of parts, shortcircuiting or breakage of pattern, which may be caused when mounting or dismounting IC.

About half of troubles can be repaired by checking or exchanging CPU Chip and EP-ROM on the CPU P.C.Board or FUSE-ROM on the I/O P.C.Board. If not repaired after that, check other IC's with reference of "B. SYMPTOM OF TROUBLE AND CHECK POINT".

1. CPU P.C.Board

(1)	Give shocks to EP-ROM and CPU Chip one by one with a plastic hammer or the like. If a symptom of the image changes, exchange the device.
(2)	Warm EP-ROM and CPU Chip one by one by a hair dryer. If a symptom of the image changes, exchange the device.
(3)	If the trouble can not be repaired by the above steps, Remove CPU Chip and check IC socket. Exchange CPU Chip with other one.
(4)	Remove EP-ROM and check IC socket. Exchange it with other one. (Check EP-ROM one by one.)

2. I/O P.C.Board

(1)	Give shocks to FUSE-ROM with a plastic hammer or the like. If a symptom of images changes, exchange it.
(2)	Warm FUSE-ROM and, if a symptom of images changes, exchange it.
(3)	Remove FUSE-ROM and check socket. Exchange it with other one.

3. Sound P.C.Board

(1)	Give shocks to CPU Chip, EP-ROM and IC-8 and warm as well as other P.C.Boards. If a symptom of images changes, exchange the device.
(2)	Remove them one by one and check IC socket. Exchange it with other one.

B. SYMPTOM OF TROUBLE AND CHECK POINT

If the trouble can not be repaired by the checks in "A. BASIC MAINTENANCE FOR P.C.BOARD", do the same to other IC's with reference of the following tables. In the tables;

"SYMPTOM" ----- Symptoms of troubles on the screen or sounds.

"P.C.BOARD" ----- The most probably trouble making P.C. Board amoung CPU, I/O and Sound P.C. Board.

"CHECK POINT" --- Parts on a P.C.Board listed in the order of probability of trouble making. If all parts are good, check other IC's with reference of the circuit diagram.

NOTES

* Illustrated images are merely reference samples. Therefore, it does not always follow that you can get the same images on the screen.

* A mark of a figure and alphabet in the column of the "CHECK POINT" shows the position of parts on the P.C. Board.

* There are three kinds of specification in CPU P.C. Board, as follows. Confirm the number printed on your CPU P.C. Board and see check points for the number.

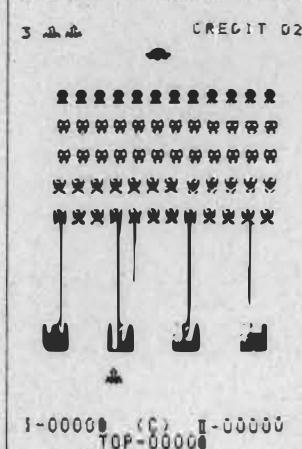

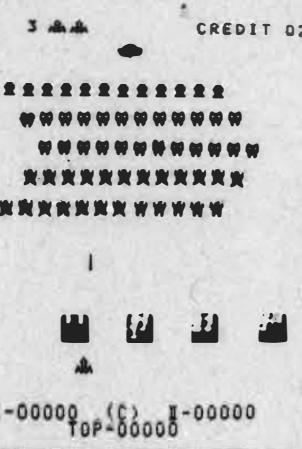

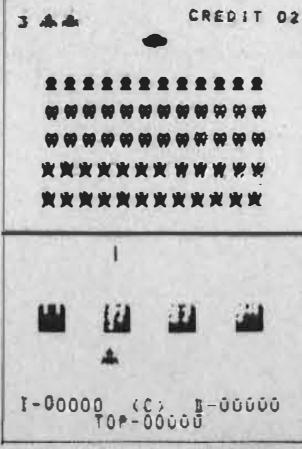

- a. TSF-CPU P1-500802
- b. TSF-CPU P1-500810
- c. TSF-CPU P1-500861

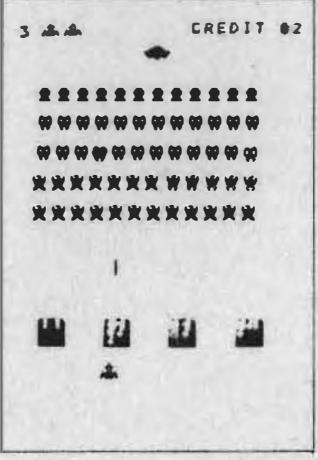

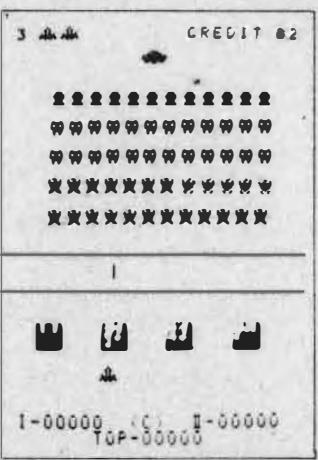

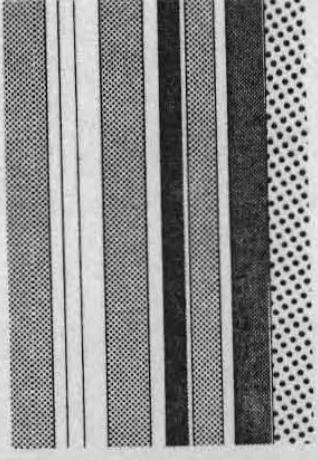

* "Image" in these tables is a general terms for images which appear on the screen, such as attacker, laser gun, shelter, spaceship carrier, laser shell, shell fired by attacker, number of credited coin, score of player and highest score.

* Troubles are roughly divided into three kinds as follows;

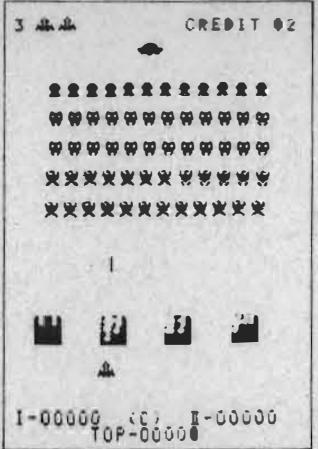

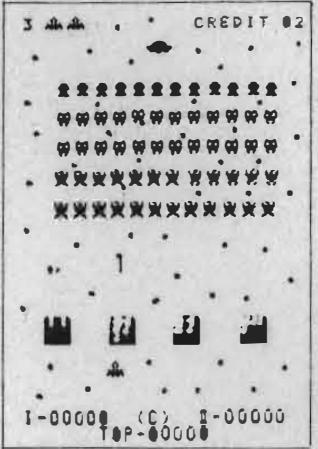

- * Troubles on image on the screen
- * Troubles on software of game
- * Troubles on sound

1. Troubles on image on the screen

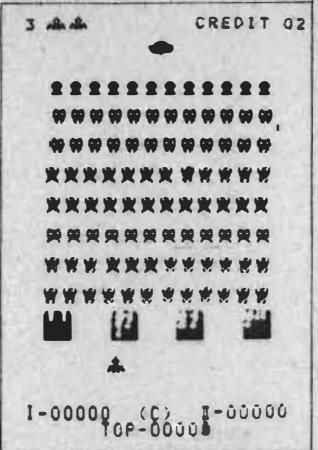

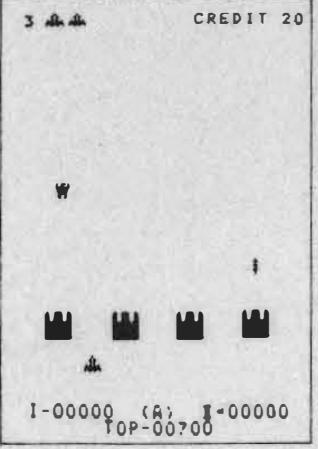

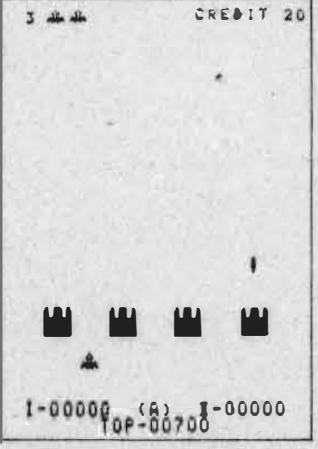

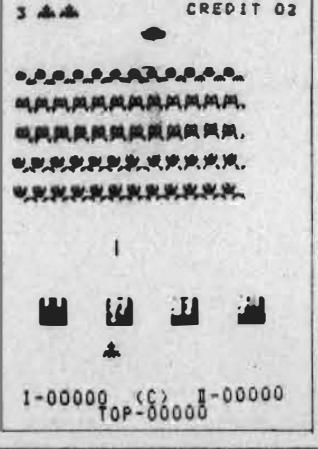

S Y M P T O M	P.C.BOARD	CHECK POINT
A shell from attacker leaves a track, making a line. At this time, there is no display and the game does not progress.	 I/O	2J 2I 3I
The image waves to sides and the game is impossible.	 I/O	4I 4J 5I 5J
White horizontal line appears on the screen, and laser shell explodes when hitting on the line.	 CPU 500802 " 500810 " 500861	5D 5E 5D 5E 5C 5D

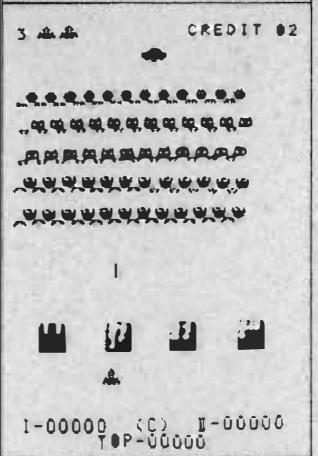

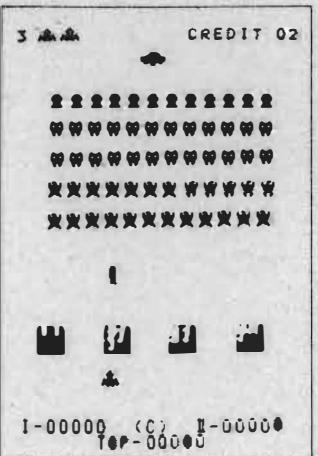

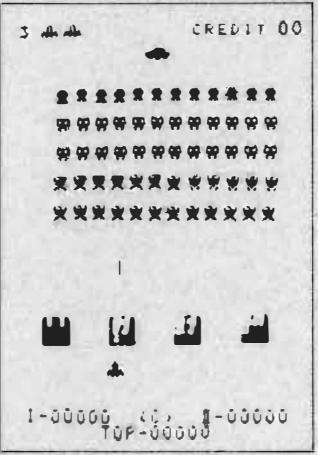

S Y M P T O M	P.C.BOARD	CHECK POINT
A group of attackers drops suddenly to the bottom of the screen. But, another group of attackers which appears first also remains on the screen.	 <p>I/O CPU 500802 " 500810 " 500861</p>	1K 2K 5J 5J 5I
Only images of figures and English letters do not appear on the screen.	 <p>CPU 500802 " 500810 " 500861</p>	4E 4E 4D
Several horizontal lines appear on the screen. Laser shells pass the lines.	 <p>CPU 500802 " 500810 " 500861 I/O</p>	5D 5E 5D 5E 5C 5D 1L
Colorful vertical stripes come out on the whole of the screen.	 <p>CPU 500802 " 500810 " 500861</p>	4G 5F 3J 3B 1B 4G 5F 3J 3B 1B 4F 5E 3I 3A 1A

S Y M P T O M	P.C.BOARD	CHECK POINT
Colorful horizontal stripes come out on the whole of the screen.	CPU 500802 " 500810 " 500861	4G 5I 4G 5I 4F 5H
Horizontal line or dotted line appears at a part or on the whole of the screen.	CPU 500802 " 500810 " 500861 I/O	5D 5D 5C 3J
White horizontal lines exist over and under attackers.	I/O	3B 1H 2J
Image flicker.	I/O	1H

S Y M P T O M	P.C. BOARD	CHECK POINT
Game progresses normally, but the background of images becomes green(red or blu). Normal one is dark gray.		I/O 4F
White dots come out on the screen. Laser shell explodes when hitting the dots.		I/O 3L
No image appears on the screen. But TV set is in order.	CPU 500802 " 500810 " 500861 I/O	1D 5H 1D 5H 1C 5G 1A 3B 1L
Several hours after power is turned on, the screen is disordered suddenly.	CPU 500802 " 500810 " 500861 I/O	5C 5E 5F 5C 5E 5F 5B 5D 5E 4J 3K
In the midst of a game, images stop in a certain pattern.	CPU 500802 " 500810 " 500861 I/O	5H 5H 5G 4I 4J 5I
In the midst of display, images stop in a certain pattern.	CPU 500802 " 500810 " 500861 I/O	5K 5K 5J 3B

2. Troubles on software of game

S Y M P T O M	P.C.BOARD	CHECK POINT
Attackers appear on the whole of the screen. Other images are normal.	 CREDIT 02	CPU 500802 5K " 500810 5K " 500861 5J
No attackers appear but one at the left(right) end of the lowest step. Other images are normal, but stopping without coming into the condition of display.	 CREDIT 20	CPU 500802 5K " 500810 5K " 500861 5J
No attackers appear during display. Other images are normal.	 CREDIT 20	I/O 1J
Legs of attacker are fixed, and only body moves.	 CREDIT 02	I/O 2J

S Y M P T O M	P.C. BOARD	CHECK POINT
Body of attacker is fixed, and only legs moves.		I/O 2D
Shell from attacker is thicker than normal one.		I/O 4I 4J
Even with coin inserted, the indication of number of credited coins is 0, and game can not be started. The screen continues the display condition and the game counter works normally.		I/O 4A 1J
Game counter works of itself when no coin is inserted.	I/O	2L
Laser shell explodes before reaching an attacker.	I/O	2D
Attacker goes backward, not forward.	I/O	3L
During display, no shell is shot from attacker.	I/O	5K

S Y M P T O M	P.C.BOARD	CHECK POINT
Two-player game is possible, but one-player game is impossible several hours after power is turned on.	I/O	1F
In two-player game, the main side game is normal, but the screen at sub side game is disturbed. (Sub side game is impossible.)	I/O	4B
Selection of one-player game and two-player game is impossible. The screen shows "Selection Instruction".	I/O	1J
In two-player game, credit is increased when sub side laser shell fire button is depressed.	I/O	4A
In two-player game, sub side laser shell can not be shot.	I/O	1I
Credit is increased when control lever is moved to left.	I/O	1J
Spaceship carrier entering sound roars, but the carrier does not appear.	I/O	5B
Credit is increased when power is turned on and off.	I/O	Condenser C-8
In two-player game, sub side score can not be increased.	I/O	3F 3J 4G
While spaceship carrier moves, it disappears suddenly and appears again.	I/O	5B 5C
Game counter does not work when coin is inserted.	I/O	2L
Laser shell stops before reaching attacker.	CPU 500802 " 500810 " 500861	3E 3E 3D
Speed of shell from attacker is too high.	CPU 500802 " 500810 " 500861	3E 3E 3D
In the midst of game, the movement of attacker to sides stops. However, shells are shot from attacker and other movements are normal.	CPU 500802 " 500810 " 500861	3H 3H 3G

3. Troubles on sound

S Y M P T O M	P.C. BOARD	CHECK POINT
With all variable resistors properly adjusted, neither melody sounds nor effective sounds come out.	SOU	IC-1 IC-2
Melody is normal, but effective sound does not come out.	SOU	IC-8
Effective sound is normal, but melody does not come out.	SOU	IC-2 IC-1
Part of melody break.	SOU	IC-2
Only laser gun explosion sound, one of effective sounds, does not come out or breaks.	SOU	IC-8 IC-5 IC-7
Effective sound is distorted. (Even if sound volume is downed.)	SOU	IC-8
In the midst of game, no sounds come out but attacker advancing sound.	I/O	2D 4B
During display, attacker advancing sound comes out.	I/O	2D
When score reach to 1,500 points, extra score sound does not come out.	I/O	Condenser C-9
Laser gun explosion sound comes out preodically.	I/O	2C 2D 1D 1C
Attacker advancing sound is not picked up in tempo. (It sounds at fixed tempo.)	I/O	2C 2D 1D 1C
Attacker re-entering sound does not come out.	I/O	2C 2D 1D 1C
Attacker explosion sound or laser gun explosion sound does not come out.	I/O SOU	2C 2D 1D 1C IC-8
All sounds do not come out.	I/O SOU	2C 2D 1D 1C IC-8

C. ADJUSTMENT OF VIDEO MONITOR

1. Adjustment

(1) Power Supply

Instrument	Condition	Tool
A tester of $20k\Omega$ internal resistance	Voltage of power supply/AC100 \pm 5V	Insulated (-) screw driver

The diagram shows a power supply circuit. On the left, there's a vertical rectangle labeled 'R609'. Above it is a small terminal block with two pins, one labeled 'TP-91' and the other connected to 'R609'. To the left of 'R609' is a component labeled 'IC601'. Below 'R609' is a resistor labeled 'R604'. To the left of 'R604' is a variable resistor labeled 'VR601' with a potentiometer symbol. Below 'VR601' is a fuse labeled 'DC 300mA Fuse'. To the right of 'R604' is a capacitor labeled 'C610'. Above 'C610' is another capacitor labeled 'C609'. A 'Tester' is connected between 'TP-91' and 'Earth'. The 'Tester' has a dial and two terminals, one positive (+) and one negative (-). A ground connection is shown at the bottom right labeled 'Earth'.

Method
<ul style="list-style-type: none"> a. Connect a tester between terminal TP-91 and the earth. b. Adjust the voltage between TP-91 and the earth to DC105V by turning supply voltage Adj. Pot. VR601. c. After adjusting, apply lacquer to VR601 to fix.

(2) Color Purity

- a. Loosening deflecting coil fixing screw, pull the deflecting coil fully backward (to CPM side).
- b. To make raster red, turn cut-off Adj. Pot. for blue and green counterclockwise fullyway, and cut-off Adj. Pot. for red clockwise completely. (If red raster is not clear, adjust brightness resistor and screen resistor.)
- c. Slightly loosen CPM magnet stopper and adjust two purity magnet knobs so that red raster of longitudinal stripes is produced on the whole of the screen.

- d. Move the deflecting coil forward little by little until the whole of the screen becomes red evenly. (If the deflecting coil fixing wedge is a hindrance, remove it as shown in Fig.2-2.) Confirm that the picture is not out of the center of the screen, longitudinally or laterally. If out, correct the picture's position by adjusting the purity magnet in a range of not deteriorating purity.)
- e. Then turning cut-off Adj. Pot. for red counterclockwise completely, check color shading of blue and green in the same manner.
- f. Tighten the deflecting coil fixing screw.
- g. When there is partial color shading in a picture, repeat above items (b) to (f).

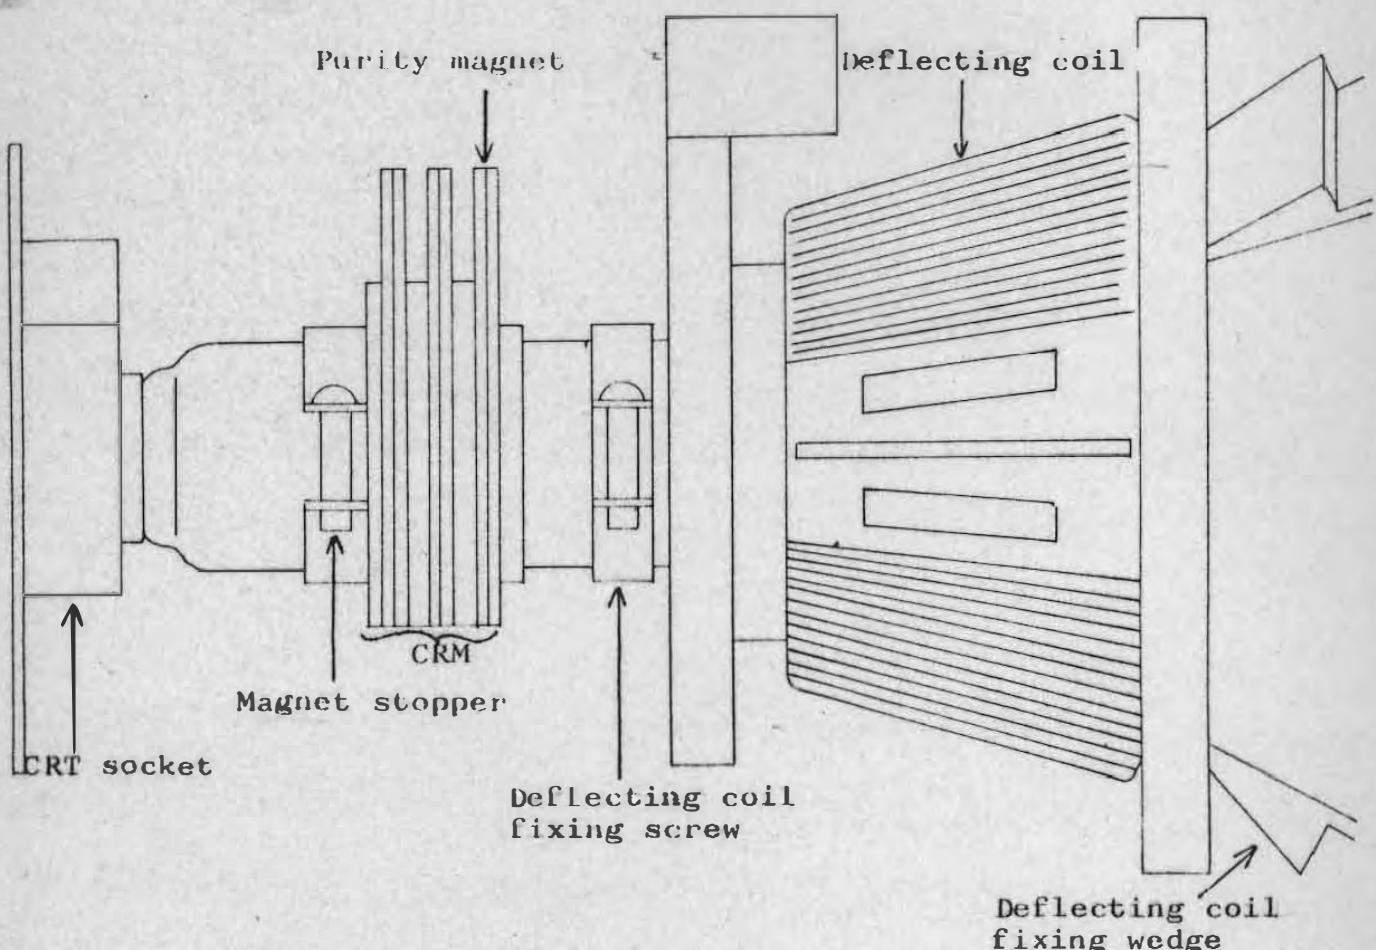

Fig. 2-1 Name of each part of neck of Braun tube

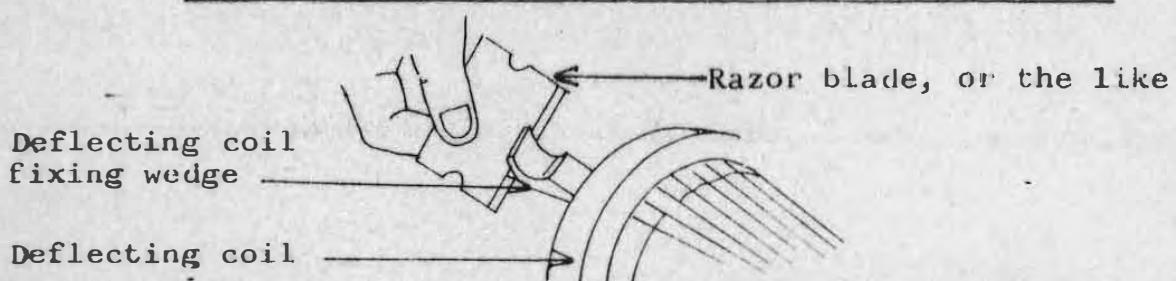

Fig. 2-2 Removing deflecting coil fixing wedge

(3) Convergence

a. Static Convergence

This adjustment is to be carried out when, along with the margin of a picture, a different color appears. For convenience of adjustment, receive cross-hatch pattern on the screen. (If it is impossible, receive a stationary picture.)

- ① Receive cross-hatch pattern on the screen.
- ② Overlap red and blue lines at the center of the screen by moving 4-pole magnet knobs. (The adjustment is easy when green pattern is put out by turning the green cut-off Adj. Pot. counterclockwise fullway.)
- ③ Overlap red/blue and green pattern at the center of the screen. (At this time, green pattern is to be on by turning the variable resistor.)

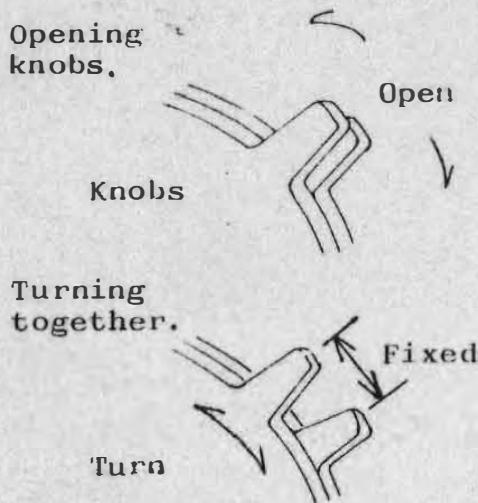

Fig. 3-1 How to move knobs

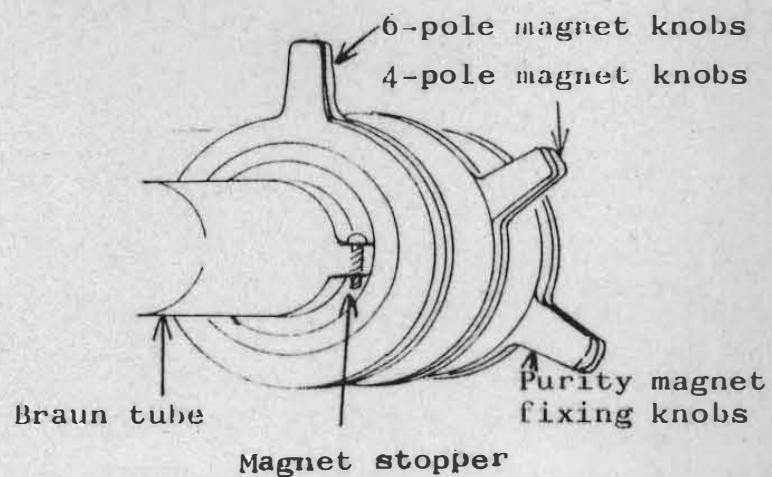

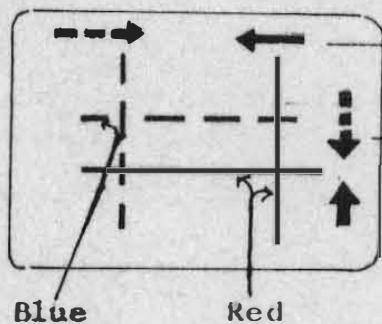

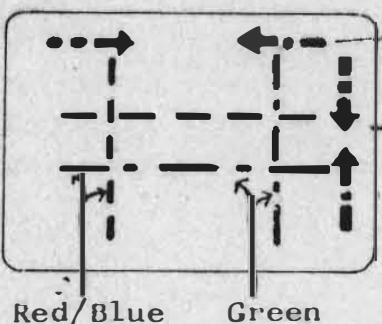

Fig. 3-2 Name of each part of neck of Braun tube

* For longitudinal lines, open two 4-pole magnet knobs.

* For lateral lines, turn two 4-pole magnet knobs together without changing the opening angle between them.

* For longitudinal lines, open two 6-pole magnet knobs.

* For lateral lines, turn two 6-pole magnet knobs together without changing the opening angle between them.

Fig. 3-3 Movement of convergence by magnet knobs

④ Correction of Static Convergence

When red, green and blue lines can not be overlapped at the center by 4-pole and 6-pole magnets, move CPM about 5mm forward or backward and try "(3) Convergence" again.

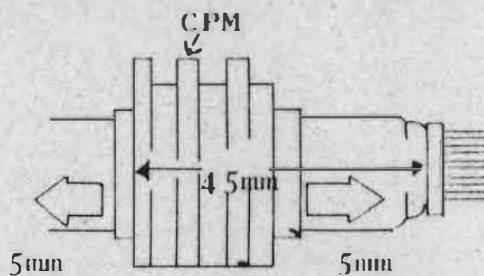

Fig. 3-4 Correction of convergence

b. Dynamic Convergence

- ① Remove deflecting coil fixing wedge.*
- ② Correct deformation of the picture at the circumference and the center of the screen by moving the front of the deflecting coil up and down.

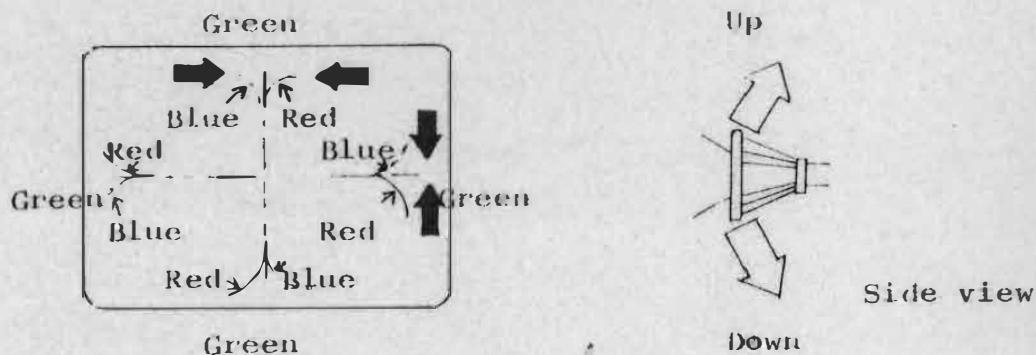

Fig. 3-5 Relation of movement of deflecting coil and convergence at circumference of screen

- ③ Correct unevenness in distance of lines at circumference of the screen by moving the front of the deflecting coil left and right.

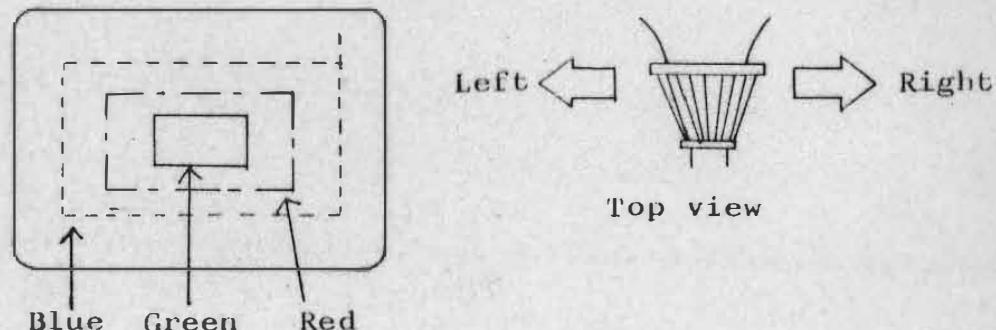

Fig. 3-6 Relation of movement of deflecting coil and convergence at circumference of screen

(4) Insert deflecting coil fixing wedge

Set vertical direction first and insert wedge (A). Then, set horizontal direction and insert wedge (B) and (C). (Looking at the screen, adjust inserting wedges little by little.)

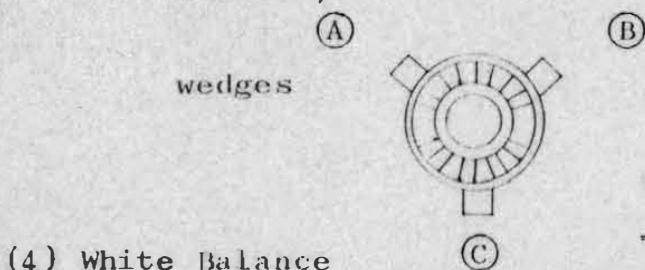

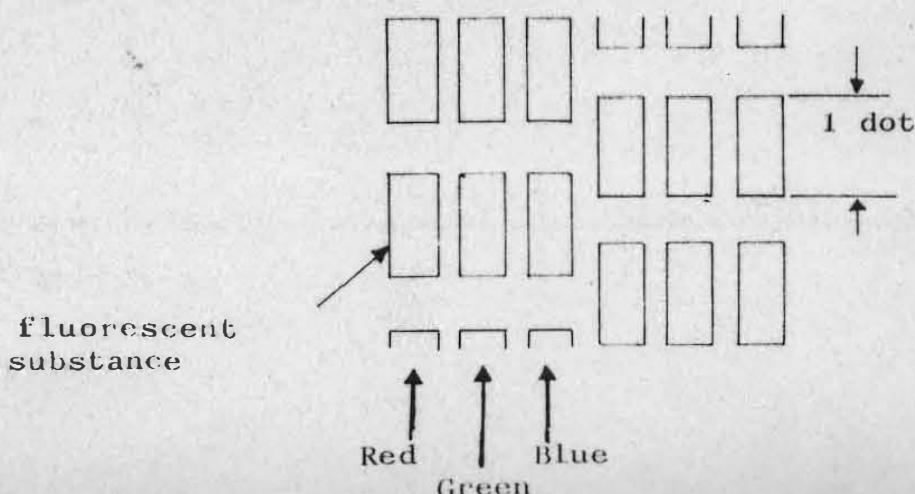

Fig. 3-7 Inserting deflecting coil fixing wedges

(4) White Balance

- a. Supply current for 5 minutes or more before adjustment.
- b. Disconnect 6p-connector from BH terminal. After that, only raster can be seen on the screen.
- c. Turn brightness Adj. Pot. to the maximum.
- d. Turn cut-off Adj. Pot. for red, green and blue counterclockwise completely.
- e. Turn screen voltage Adj. Pot. counterclockwise completely.
- f. Set red and blue drive Adj. Pot. at the center of their rotation
- g. Insert service connector inversely. (To service side)
- h. Turning screen voltage Adj. Pot. clockwise, receive a red, green or blue horizontal narrow raster of 1 dot. (If any color does not appear, turn the screen voltage Adj. Pot. clockwise completely.)
- i. Turn cut-off Adj. Pot. for color not seen on the screen clockwise and adjust to make a horizontal white raster of 1 dot.
- j. Set the service connector normally, and adjust red and blue drive Adj. Pot. so that the screen becomes white.
- k. Set the service connector to service side again and confirm that the horizontal narrow raster is white. If not, repeat adjustments (8) and (9) without touching the drive Adj. Pot.

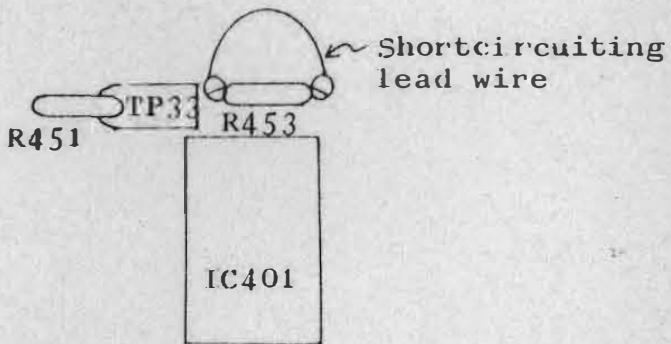

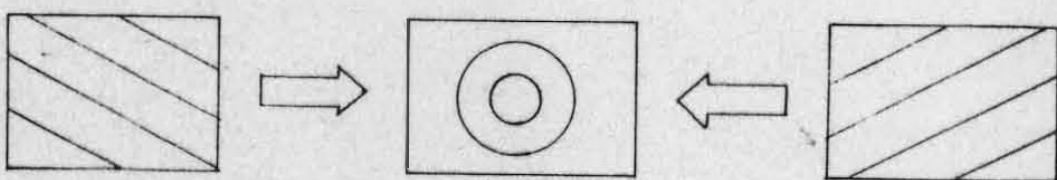

* "1 dot" means the longitudinal length of a fluorescent substance.

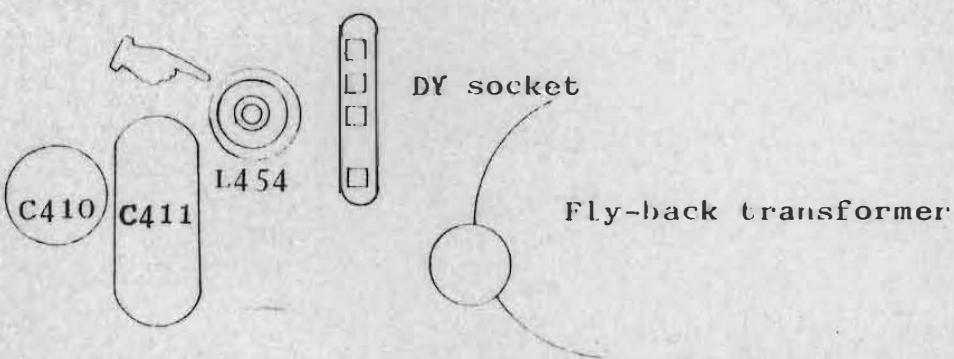

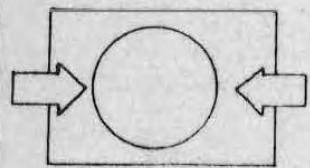

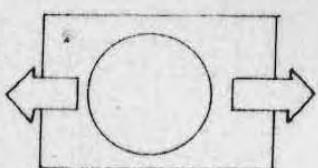

(5) Beam Current

Instrument	Condition	Tool
A tester of $20k\Omega$ internal resistance	Voltage of power supply/AC100 $\pm 5V$	Insulated (-) screw driver
Method <ul style="list-style-type: none"> a. Supply current for 5 minutes or more before adjustment. b. Disconnect 6p-connector from BH terminal to produce raster only on the screen. c. Set brightness Adj. Pot. to the maximum. d. Connect (+) terminal of the tester to terminal TP452, (-) terminal to TP451. e. Adjust voltage between TP452 and TP451 to 0.5V by turning sub brightness Adj. Pot. VR201. 		

(6) Horizontal Oscillation Frequency
 (Horizontal Synchronization Adj. Pot.)

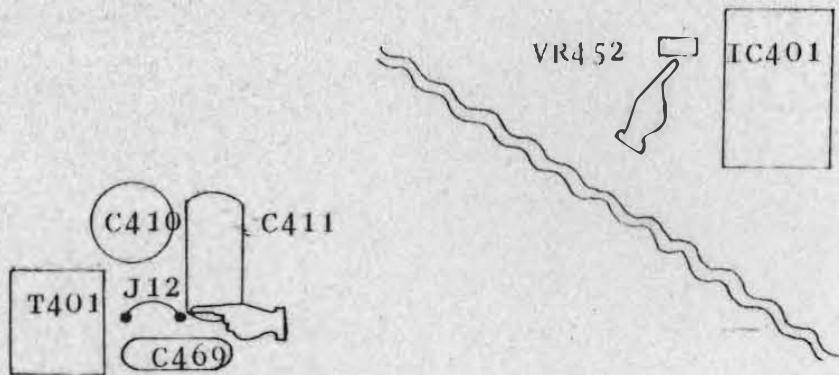

Instrument	Condition	Tool
	Voltage of power supply/AC100 ± 5V	Shortcircuiting lead wire
	Receive pattern.	
Method		
<ul style="list-style-type: none"> a. While receiving pattern, shortcircuit R453 with a lead wire. (Or, shortcircuit TP33 and the earth with a lead wire.) b. Adjust horizontal synchronization Adj. Pot. to produce a normal pattern on the screen. 		

(7) Width (Horizontal Amplitude)

Instrument	Condition	Tool
	Voltage of power supply/AC100 \pm 5V Receive pattern.	Hexagonal regulating rod
		
Method		
<p>a. Supply current for 5 minutes or more before adjustment.</p> <p>b. Adjust width (horizontal amplitude) by turning adjusting coil L454.</p>		
 		
		
<p>Turning adjusting coil counterclockwise decreases width.</p>		
		
<p>Turning adjusting coil clockwise increases width.</p>		

(8) Horizontal Center Position

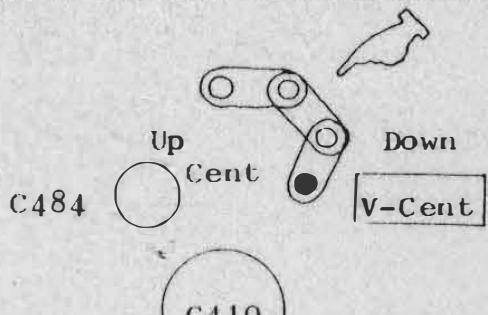

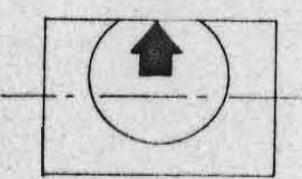

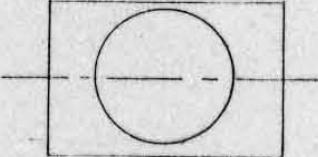

Instrument	Condition	Tool
	Voltage of power supply/AC100 ± 5V	Insulated (-) screw driver
	Receive pattern.	

Method

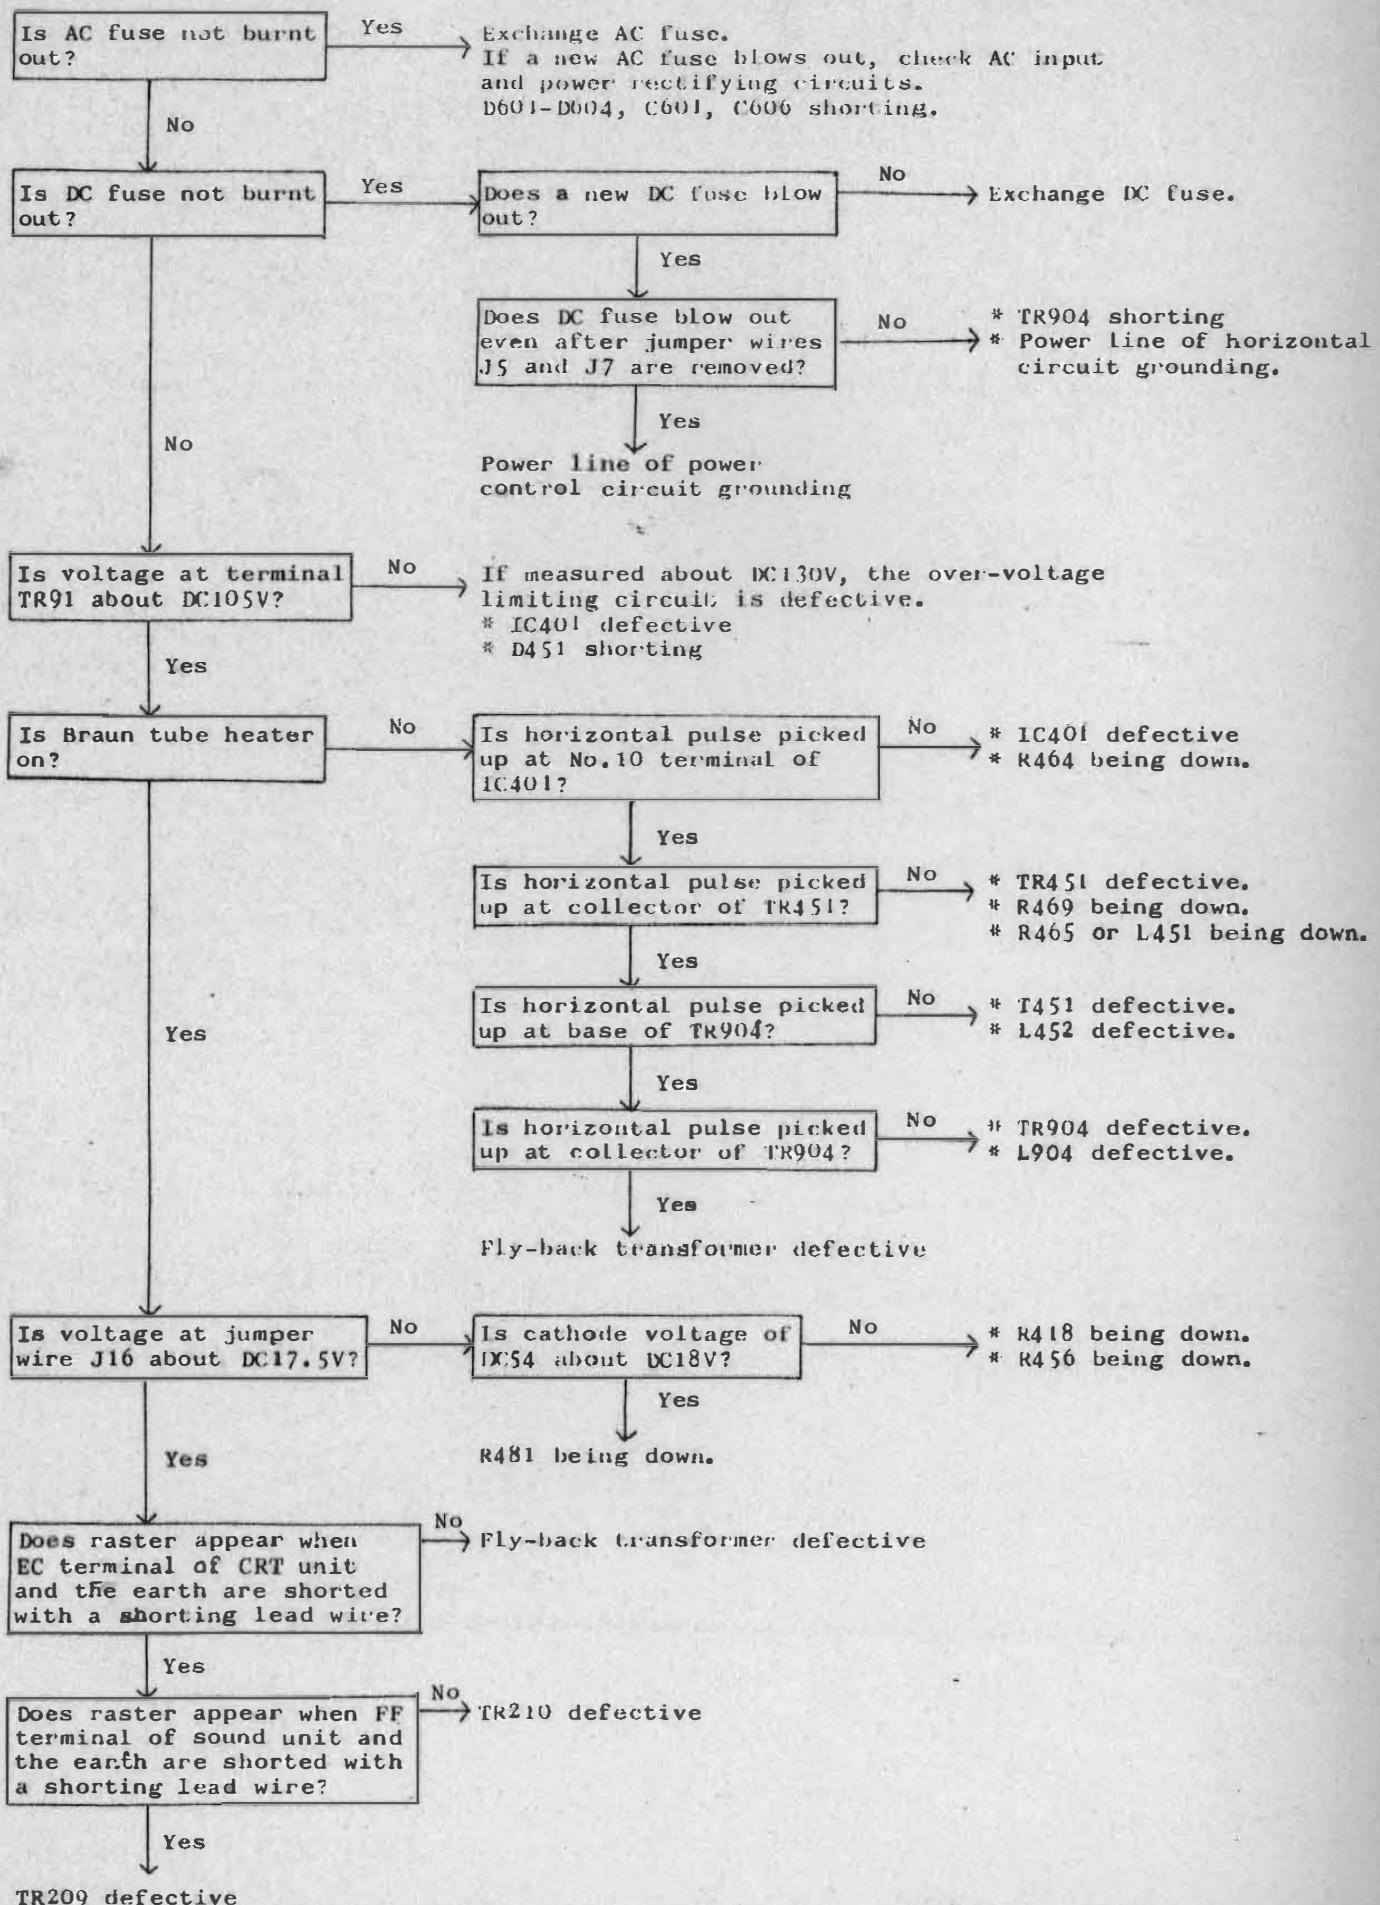

- a. Set horizontal center position Adj. Pot. VR452 at the center of its rotation.
- b. Receive a pattern on the screen and check its horizontal center position. When the position is off center of the screen to right or left, use horizontal center position adjusting jumper wire J12 to adjust.
 - * When J12 is cut off, the pattern moves to left.
 - * When J12 which is cut off once is shortcircuited, the pattern moves to right.
- c. When the horizontal center position of the pattern is still off the center of the screen after using J12, use horizontal center position Adj. Pot. VR452.
 - * When VR452 is turned to right, the pattern moves to right.
 - * When VR452 is turned to left, the pattern moves to left.

(9) Vertical Center Position

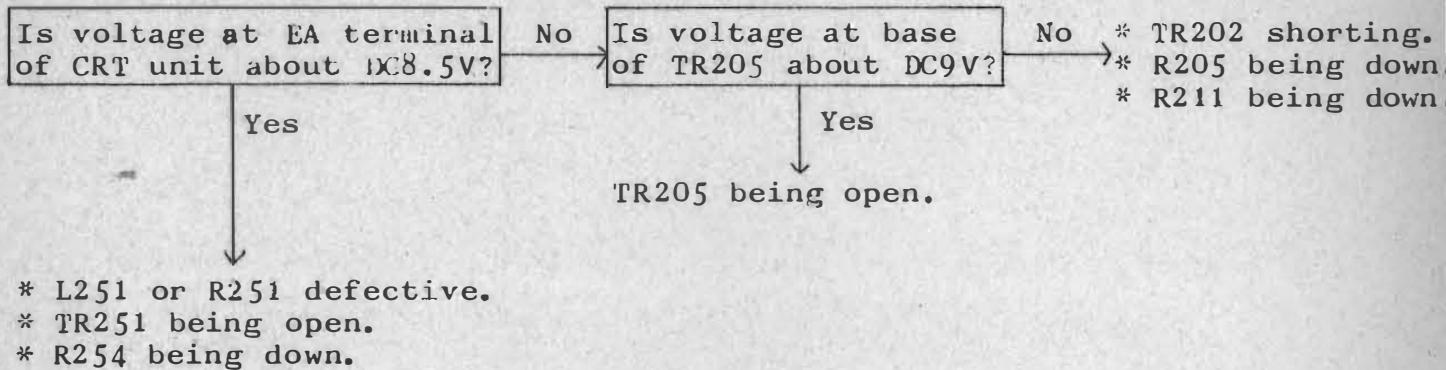

Instrument	Condition	Tool	
	Voltage of power supply/AC100 ± 5V	2p-shorting housing	
	Receive pattern		
			
		(2p-shorting housing)	
<table border="1"> <tr> <td>Method</td> </tr> </table>		Method	<p>a. Receive a pattern on the screen and check its vertical center position. When the position is off the center of the screen up or down, insert 2p-shorting housing into vertical center position adjusting terminal.</p>
Method			
			
		<p>Up</p>	
			
<p>When 2p-shorting housing is inserted into UP terminal, the pattern moves upward.</p>		<p>When 2p-shorting housing is inserted into DOWN terminal, the pattern moves downward.</p>	

2. Troubleshooting

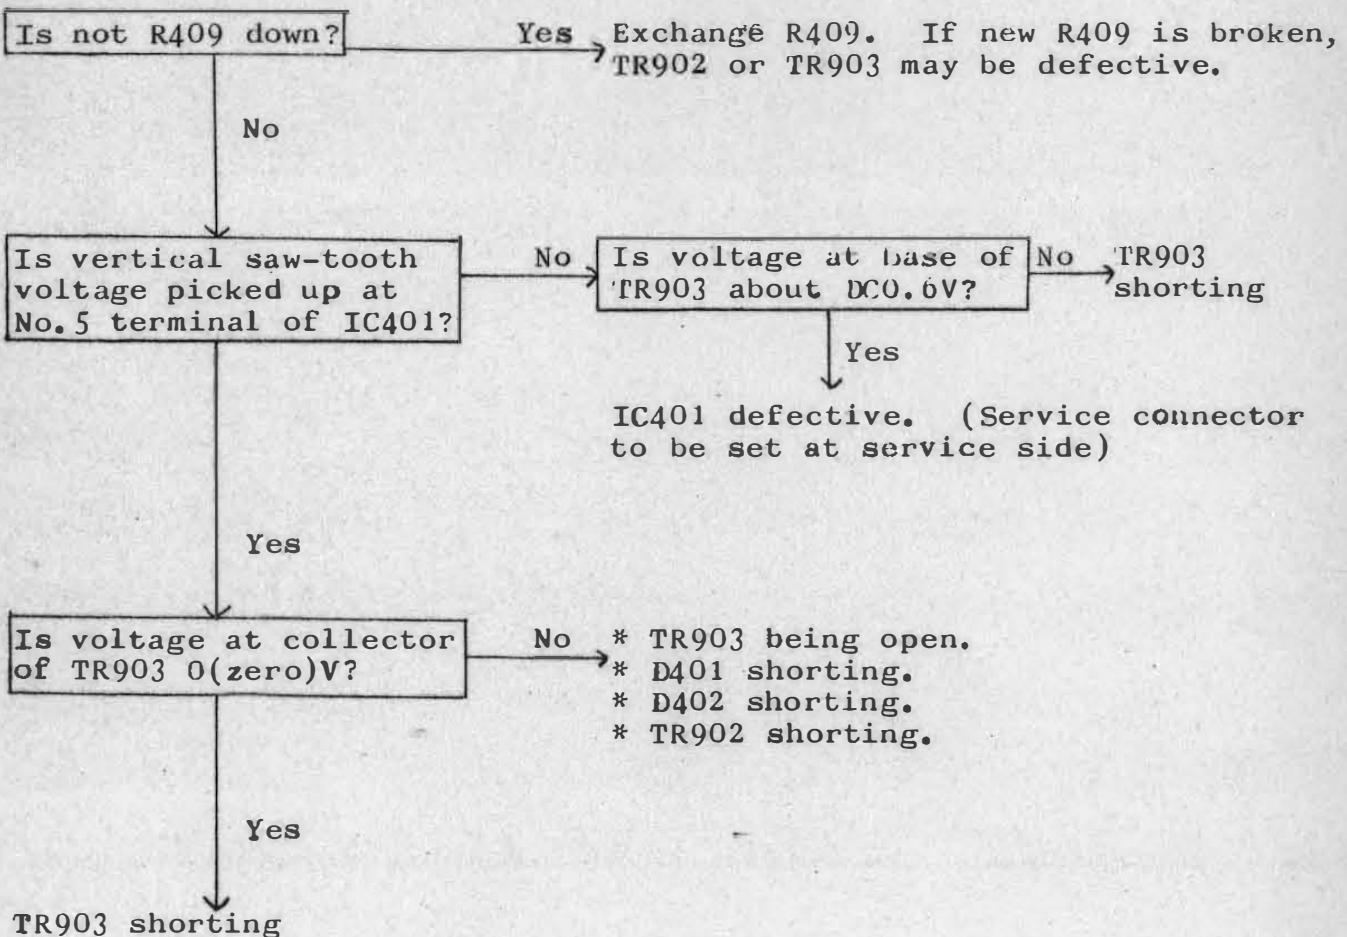

- (1) No raster on the screen
 (Confirm that brightness knob is not set at the leftmost position.)

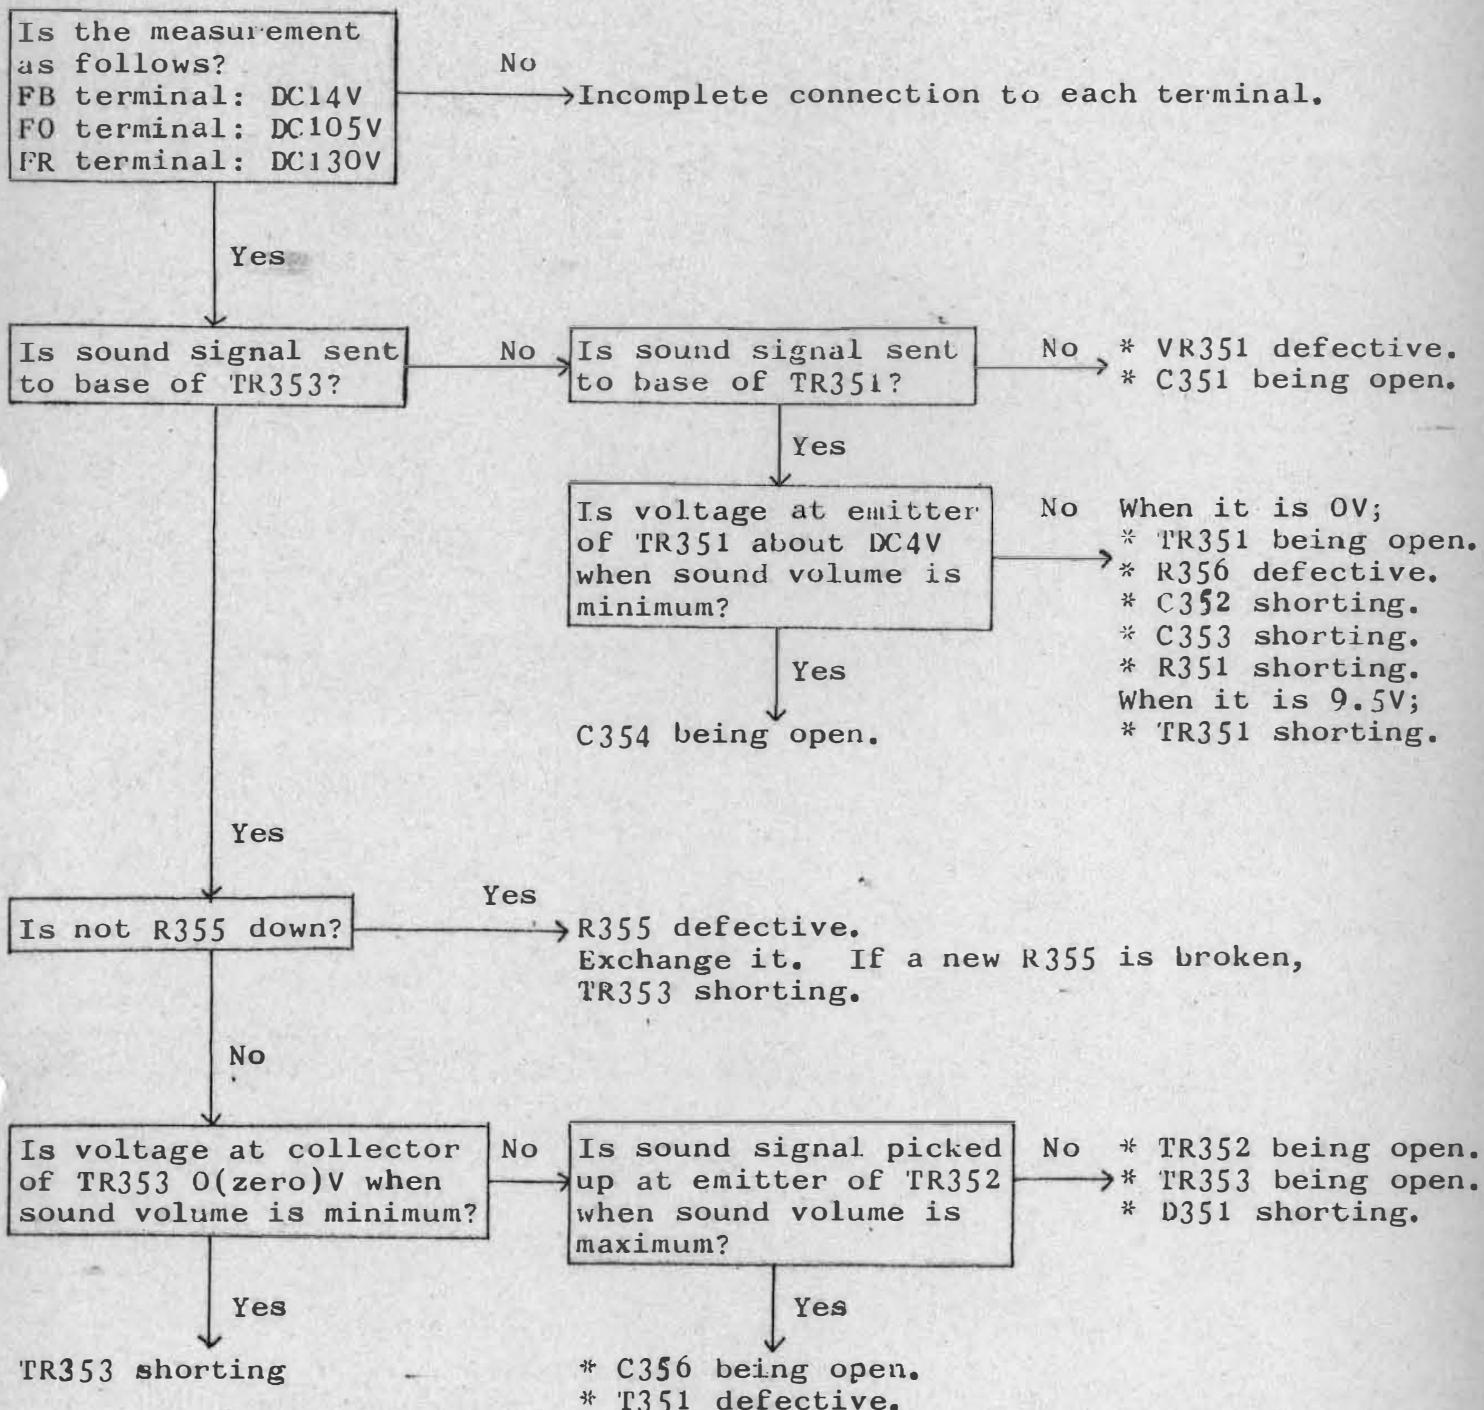

(2) One of red, green and blue does not appear.
 For any color, the inspection method is the same. (This inspection is carried out without pattern on the screen.)

(3) Picture on the screen becomes a lateral narrow line. (Check service connector.)

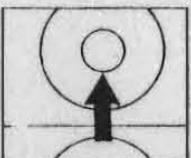

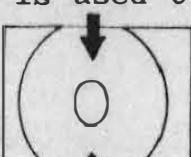

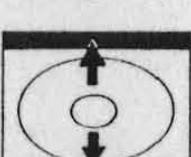

(4) No sound
 (Confirm sound volume adjusting knob first.)

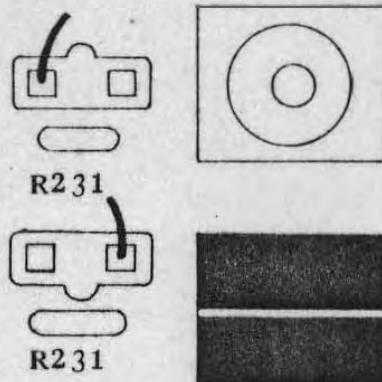

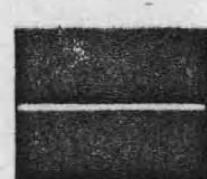

3. Function of Each parts

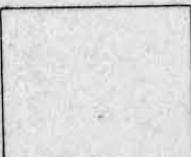

For arrangement of variable resistors and other switches, see Fig.1 - Fig.3. (Page 29 - 30)

Name of parts	Function
Sound volume (See Fig.3.)	Turning the volume knob to right turns up the volume, and to left turns down.
Brightness (See Fig.3.)	Turning the brightness knob to right makes the whole of the screen bright, and to left dark.
Horizontal synchronization (See Fig.3.)	<p>This is used when a picture runs to right or left.</p>  <p>* Turn the knob to left to stop a picture running to right downward.</p>  <p>* Turn the knob to right to stop a picture running to left downward.</p>
Vertical synchronization (See Fig.3.)	<p>This is used when a picture runs upward or downward.</p>  <p>* Turn the knob to right to stop a picture running from down to up.</p>  <p>* Turn the knob to left to stop a picture running from up to down.</p>
Vertical amplitude (See Fig.3.)	<p>This is used to adjust vertical amplitude.</p>  <p>* Turning the knob to left makes vertical amplitude small.</p>  <p>* Turning the knob to right makes vertical amplitude large.</p>

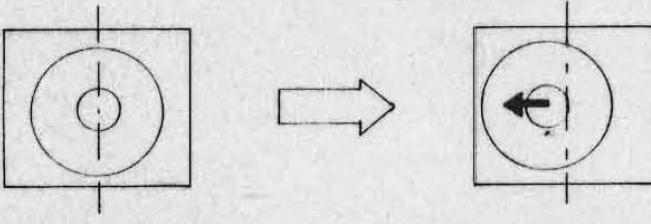

Function of service connector and variable resistor which are not required for ordinary adjustment.

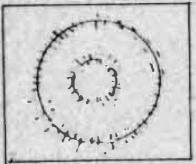

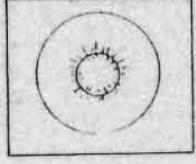

Note: If any of these controllers is touched, it should be re-adjusted with testing instruments.

Name of parts	
Screen (See Fig.2.)	<p>This variable resistor is used to adjust screen voltage of braun tube. Turning the knob to right raises the screen voltage, making the whole of the screen bright. Turning the knob to left lowers the screen voltage, making the whole of the screen dark.</p> <p>* This is used only for adjustment of white balance.</p>
Service connector (See Fig.1.)	<p>This is used in adjustment of white balance to switch a picture on the screen from a normal to a horizontal narrow line.</p>  <p>* A picture is normal when the service connector is connected as shown in the left.</p> <p>* A picture is a horizontal narrow line when the service connector is connected as shown in the left.</p>
Cut-off (See Fig.2.)	<p>These are Adj. Pot. for adjustment of white balance. Ordinarily, these are used after a white-and-black image is changed into a horizontal narrow line by the service connector.</p> <p>Green cut-off: This Adj. Pot. is for green color adjustment. Turning the right makes green color bright, and to left dark.</p> <p>Blue cut-off : This Adj. Pot. is for blue color adjustment. Turning to right makes blue color bright, and to left dark.</p> <p>Red cut-off : This Adj. Pot. is for red color adjustment. Turning to right red color bright, and to left dark.</p>  <p>Each cut-off Adj. Pot. should be adjusted so as to make a white-and-black image in a horizontal narrow line white.</p>

Name of parts	Function
Drive (See Fig.2.)	<p>These are Adj. Pot. for adjustment of white balance. Ordinarily, these are used when a white-and-black picture is received.</p> <p>Blue drive: Turning the knob to right makes blue color deep, and to left light.</p> <p>Red drive: Turning the knob to right makes red color deep, and to left light.</p>  <p>Blue and red drives should be adjusted so as to make a white-and-black picture white.</p> <p>Make picture white.</p>

Other adjusting points

Horizontal position (See Fig.1.)	<p>This is a jumper wire which is used to change horizontal position of a picture.</p> <p>A picture moves to left when the jumper wire is cut.</p>  <p>Center Before jumper wire is cut Center After jumper wire is cut</p>
Vertical position (See Fig.1.)	<p>These are terminals to change vertical position of a picture.</p>  <p>A picture moves upward when 2p-shorting housing is inserted into upper terminal.</p> <p>A picture moves to the center in the vertical direction when 2p-shorting housing is inserted into middle terminal.</p> <p>A picture moves downward when 2p-shorting housing is inserted into lower terminal.</p>

Name of parts	Function
	<p>This is a Adj. Pot. to change focus voltage.</p>  <p>When the whole of the screen is out of focus, turn focus knob to right.</p>  <p>When the center of the screen is out of focus, turn it to left.</p>

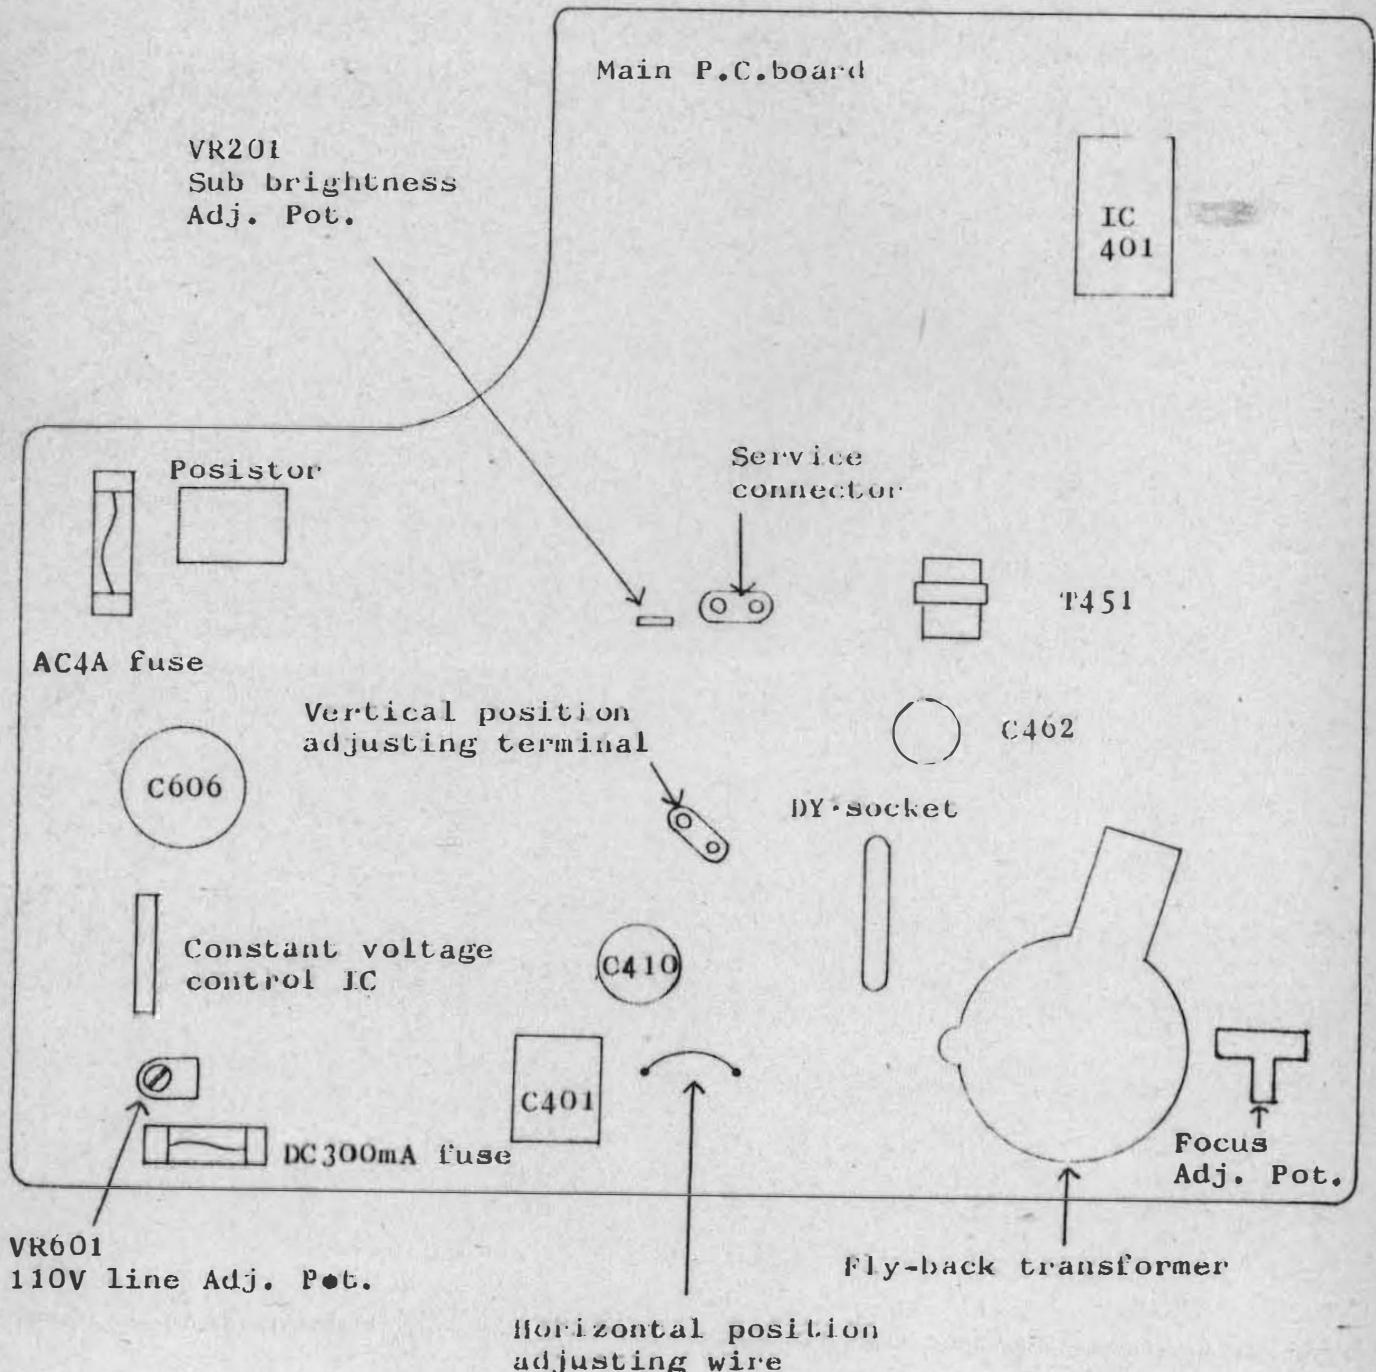

Fig. 1

F. CIRCUIT DIAGRAM

If the trouble can not be repaired by the checks in all steps, check again with reference of the following circuit diagrams.

NOTE

CPU P.C.Boards are available in three kinds in specifications as follows. Confirm the number printed on your CPU P.C.Board and see circuit diagram for the number.

* TSF-CPU P1-500802

IC74LS241 is mounted at the position of "1B" and "1C" on the P.C.Board.

* TSF-CPU P1-500810

IC8216 is mounted at the position of "1B" and "1C" on the P.C.Board.

* TSF-CPU P1-500861

This P.C.Board designed for common use for IC74LS241 and IC8216. When either IC is mounted, the space for another IC is open.

Note that, only on this P.C.Board, alphabets instructing position of parts start with "Z".

REMARKS)

*Condensers are ceramic or electrolytic unless otherwise specified.

*Resistors are $\frac{1}{2}W$ coated carbon film resistors, unless otherwise specified.

*Withstand voltage of condensers is 50V, unless otherwise specified.

*Symbols on resistors and condensers and their meanings;

(W) : Coated wire wound resistor

(N) : Coated metal film resistor

(R) : Metal oxidized film resistor

(Y) : Insulated wire wound resistor

(C) : Carbon composition resistor

(F) : Polyethylene Telephthalate film condenser

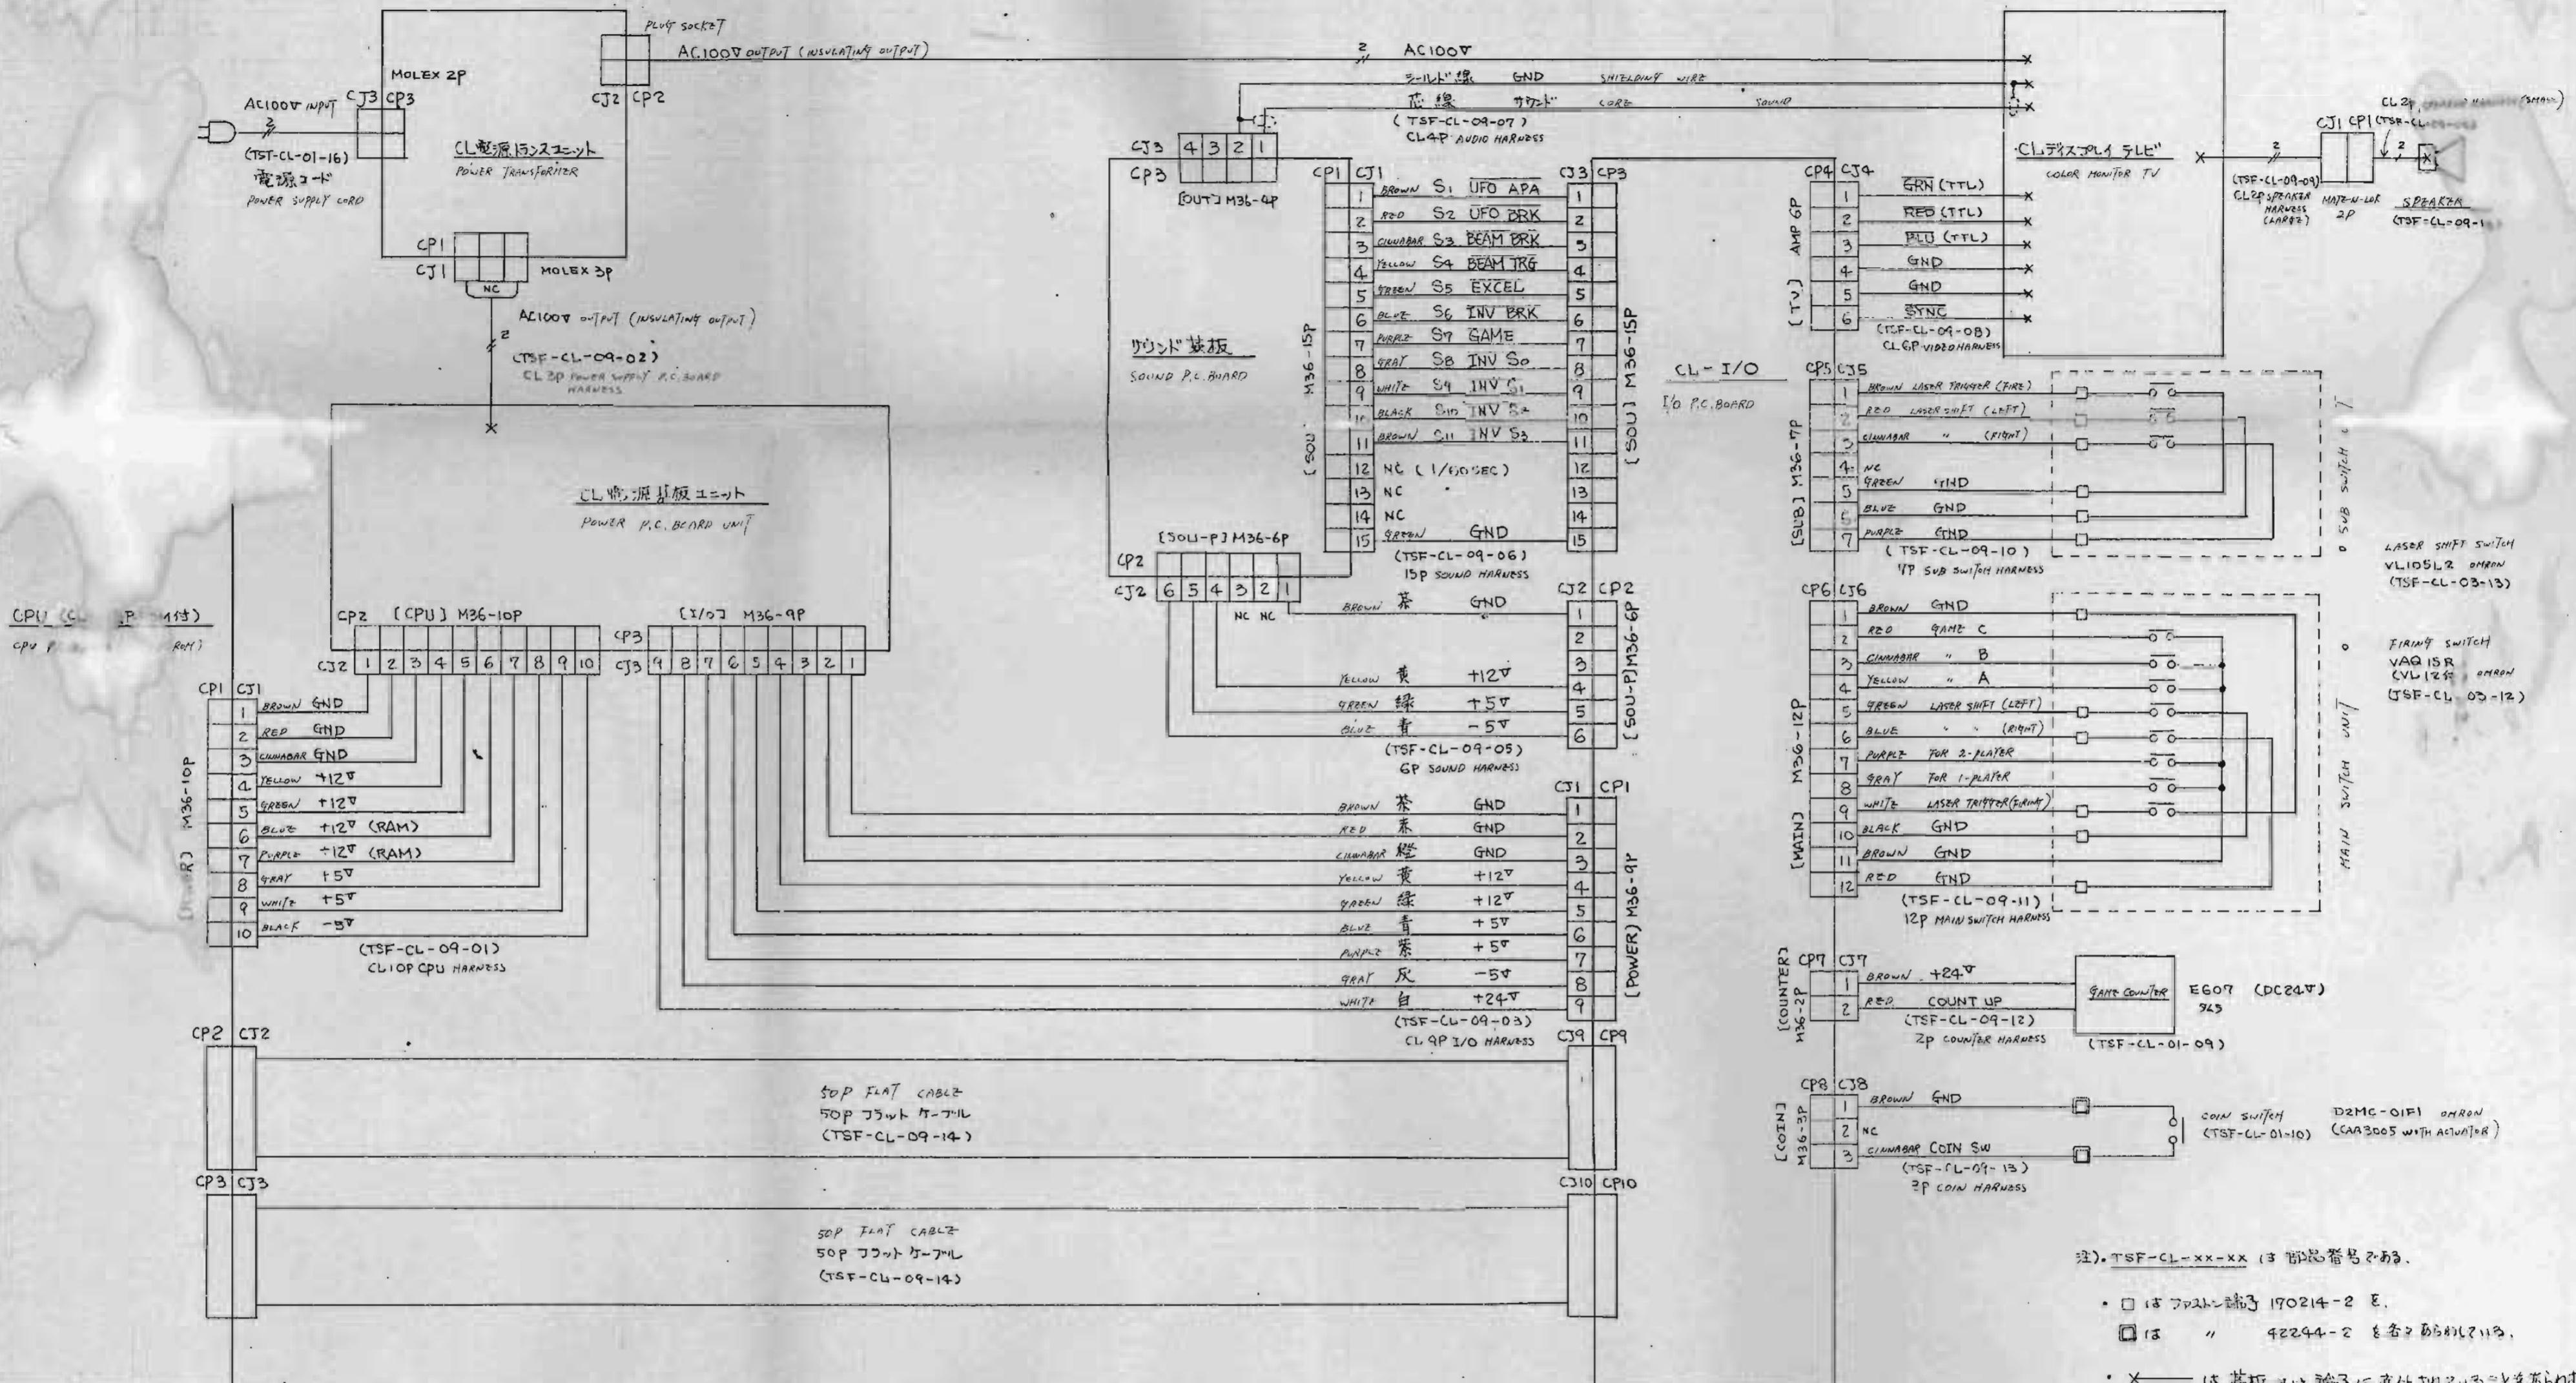

(N) : Polypropylene film condenser

NP : Non-polar electrolytic condenser

*Part No. of a 180-ohm resistor connected to the 7th pin of IC401 is not decided yet as of June 1, 1979.
